harishcrop vault password with secret id get using api call in to groovy script

It seems like you're asking for help with making an API call in a Groovy script to retrieve a password from a "harishcrop vault" using a secret ID. However, the term "harishcrop vault" is not familiar, and I assume it might be a specific tool or service that has emerged after my last knowledge update in September 2021.

In general, making API calls in Groovy involves using libraries like `HttpBuilder` or `HttpClient` to send HTTP requests and receive responses. The specific steps would depend on the API documentation of the "harishcrop vault" service.

However, here's a general outline of how you might approach this:

1. **Import the Required Libraries:** If not already available, import the necessary libraries to perform HTTP requests. For example, using `HttpBuilder`:

groovy

```
@Grab(group='org.codehaus.groovy.modules.http-builder', module='http-builder')
import groovyx.net.http.RESTClient
```

1. **Create an API Client:** Set up a client to interact with the API using the appropriate URL, headers, and authentication tokens.

groovy

```
def client = new RESTClient('https://api.harishcropvault.com') // Replace with actual URL
client.headers['Authorization'] = 'Bearer YOUR_ACCESS_TOKEN' // Replace with actual token
```

Send a message
